

Walkie-Straddle Truck

Capacity 2000lb. 2500lb. 3000lb.

EWS 10/12/14HD 24 volts

SERIES 1169

Performance

The 24-volt Walkie Straddle is a cost-effective way to handle your product efficiently with excellent maneuverability. With a high level of performance, even the most demanding applications are a good fit for the Electric Walkie Stacker.

Maintenance

All electric, electronic, and hydraulic components are conveniently mounted in the chassis. Accessibility is easy, even with the truck in the working aisle. These time and money saving details are appreciated by both the technician and operations manager.

Drive Motor

The EWS has a 24-volt AC enclosed motor, with few moving parts under the compartment. Excellent performance, dependability and low energy consumption are provided with the latest AC technology available. When you match the drive unit and fewer electrical connections, you have a dependable unit you can count on.

Linde Material Handling

Linde Controller

Maintenance-free ensures: efficient, infinite control from zero to creep speed, and up to maximum speed. The EWS accelerates and decelerates sensitively and smoothly. Less AMP draw relates to long run times between charge. The result, efficient maintenance-free components, ensures a dependable cost-effective answer to your material handling needs. The new stacker also includes an advanced torque range when operating in an uneven floor environment. An example would be large expansion joints, inclines or whenever extra torque is needed.

Technical data

April 2016 / Series 1169

	Manufacturer		Linde		Linde				
	1.1	Model designation		EWS10 (24-volt)		EWS12 (24-volt)		EW	
1.2	Power unit: Electric, Diesel, LP, Other		Electric		Electric

	6.10	Speed control		Infinitely variable		Infinitely variable		Inf	
	6.11	Hydraulic control		Infinitely variable		Infinitely variable		Inf	

Features

Drive unit

A premium-sealed AC motor is provided to handle coolers or freezer applications. The master drive unit is located directly under the motor. Both main units have a proven track record of reliability.

Hydraulic system

The integral hydraulic power unit is self-contained to eliminate unnecessary oil lines and fittings. The seamless tank is mounted directly below the pump and motor for easy access.

Frame

The core components utilize heavy steel plates welded into a rigid unitized structure, resulting in a frame that will not distort under the most severe operating conditions. The EWS can handle the heaviest loads at a operating cost of a walkie, as compared to a rider truck.

Tru-view masts

A high-visibility mast with chrome plated pistons are standard. To resist deflection from off-center loading, a casting is used instead of fabricated steel. Castings for cross-bracing provides greater strength than fabricated steel. Sealed roller bearings are also used to ensure a maintenance-free mast.

Carriage

A standard hook-type carriage, constructed from alloy steel plates on large-load rollers.

Forks

Universal pallet forks. Class II hook-type mounting is standard.

Outriggers

The steel outriggers are available in a range of widths. For added service life, the load wheels are mounted in steel housings and protected by tapered, enclosed tips. The outriggers are welded into the mast support members as an integral part of the chassis.

Wheels and tires

A rubber drive tire and single-load wheels are standard.

Operator control

The Linde tiller arm on these pallet trucks and stackers combine both ergonomically smart and intuitive feel. The advanced material is a high-performance polymer chosen for the wide range of operating temperatures stackers might operate in. The truck's lifting and travel speeds are proportional. This means you have complete control of the load. All the truck's basic controls, lift, lower, and horn, can be operated effortlessly by either left- or right-handed operators. This can be accomplished

without removing their hands from the control handle. A reversing switch located at the end of the steering handle will automatically reverse the truck's travel direction if it comes in contact with an object.

Brakes

Auto Deceleration (ADS) and "plugging" are the main method for stopping the truck. Smooth, controlled braking is accomplished when the steering handle is in a vertical or horizontal position. When the control handle is released, a spring returns the handle to the vertical position which applies the brake and cuts travel power.

Battery compartment

No valves, oil lines, fittings, or electrical components are located under the chassis or battery.

Standard equipment

- Linde Transistor Controller
- 24-volt AC electrical system
- Non-articulating drive unit
- Electromagnetic disc brake with power cutoff
- Key switch
- 48" load backrest
- 42" forks
- 4" x 2.9" single load wheels
- 9" x 3" rubber drive tire
- Safety spring return handle
- Impact resistant covers
- Plexi-glass
- SB175 red connector (24V)
- Battery discharge indicator with lift interrupt (24V)
- Porportional lift and travel
- Stability caster

Optional equipment

- Travel/Backup alarm (forks first travel)
- Travel/Backup flashing lights
- Cold storage protection
- Tandem load wheels
- 3-stage full freelif options
- Wire mesh mast screen
- Pin code access

Check with dealer/factory for additional equipment availability.
